The Video camera or video camera capture device (as those terms are used in this specification) is a digital device for capturing images of light. A digital image is the result of an image sensor capturing light, which is translated into an electronic signal that can be manipulated before storage in a computer database. The image signal may be used to produce a video signal that is further processed by a video display device. The converted signal may be stored as a digital file or in the form of a video bitstream. The electronic image captured by a video camera may be analogue or digital. A video camera may be any device (analogue, digital or hybrid) that converts light into a video signal, the output of which may be stored in analog or digital form. Digital video cameras use solid state image sensors such as charge-coupled devices (CCDs), complementary metal-oxide-semiconductor (CMOS) image sensors, or Active-pixel sensors (APS). An analogue video camera may use a continuous-time amplifier (lens or film) to capture light. For example, the video signal may be generated via conventional frame grabber or via a similar acquisition process. The video signal may then be transmitted over a physical network (serial links such as RS232 or USB) to another receiving device, which will receive and store the signal in order to output a video image on a screen for display to a viewer or to save as a file. A video capture device may also be implemented as a multimedia adapter attached to a personal computer (PC), where the PC will receive and process the video signal from the video capture device and display the video on the PC's display screen. A software solution may be used to capture and store a video image in computer files. A signal may be in a format suitable for storage in a computer or mass media. What's New in the AMCap?

> AmCap is a powerful application that can facilitate the previewing and recording of webcam and camcorder devices. The program is compatible with Microsoft DirectShow and is capable to deliver high-quality recordings. > There are a wide array of webcam recording applications in today's market, but the best choice is always a compromise between price, ease of use and performance. One application that fits this pattern is AMCap. > This program can record both video and audio sources and features analog TV tuner support. It can work with multiple monitors and is able to compress the recordings to AVI or WMV format. > AMCap's developers saw simplicity and ease of use as priorities when they rolled out the application, which translated (and still does) into a pleasant experience for the end user. Everything is easy to understand and follow, starting with the installation process (which requires you to press a few Next buttons) and ending with the GUI, which makes an impression though a very good management of resources and space. > The incorporated menus hold all the features that make it a keeper, while a larger area is reserved for the recording itself. Not to mention that AMCap automatically recognizes the camera (webcam/camcorder / USB camera) that is currently plugged in and starts transmitting the images that are being filmed. > The application is also able to record from an audio source, thus making it possible to produce home-made movies accompanied by sounds. Other features include alpha-blended overlay video capabilities, full-screen mode, deinterlacing support, digital zoom, to name just a few. > All in all, AMCap can make the most of webcam, allowing you to record anything you want from a simple and user-friendly environment that both beginners and professionals will appreciate. > > AMCap Requirements: > Windows 98/ME/2000/XP/Vista/Win7 > Windows 2000/2003/XP 32-bit/64-bit > Framework 1.1, 2.0, 2.5 or 3.0 > Processor: Pentium III 500 MHz or more > RAM: 256 MB minimum, 512 MB more recommended > Hard disk: 50 MB or more > Video: 256 color/32-bit color > Codecs: Windows Media Video Version 9 VC-1 > Sound: Mixer-compatible sound > Related Softwares: > Windows 98/ME/2000/XP/Vista/Win
